

RCC-OMP — Testing & Changes Required

Consolidated post-testing change list • Latest website testing pass

1. Backup Activities

1. Remove all visible/generated internal Backup IDs beginning with "BK-" from Backup Activities UI. The user-entered System ID remains the actual System ID and must be used wherever required.
2. Remove the Calendar option/tab from Backup Activities.
3. Keep Backup History and make completed backup records available through the History option.
4. Audit the complete flow: creation → due date → recurrence → reminder → completion → persistence → history → next recurring job.
5. Rebuild the Backup PDF to follow the same RCC official report/form pattern used by Preventive Maintenance. Match the pattern/layout/format, not PM-specific content.
6. Fix Backup PDF date mapping. Each date field must use its correct source/meaning; do not repeat the same date in unrelated fields.
7. Ensure Last Verified and Institution Name come from actual stored completion data in the completed view/report.
8. Connect Backup Storage to the overall machine/system storage flow. Storage entered during completion must be reflected in the connected machine/system record and in the completed backup record.
9. Reduce Backup footer spacing to match the compact QA Activities appearance while retaining the footer.
10. Verify completed Backup data survives refresh/reload.

2. QA Activities

1. After a QA task is completed, Snooze must not be available/allowed.
2. Provide a safe single-record edit/change option so a mistaken task/record can be corrected without breaking recurrence or history.
3. After completion, the completed QA record/comment/details must appear in History.
4. Verify QA completion dates, recurrence loops and next-due calculations.

3. System Inventory

1. Fix the table/form layout where Warranty Date and Purchase Date currently appear under the "#" column. Map each field to its correct column/header.

4. Inspection

1. Fix recurrence logic for both GxP and non-GxP inspections. The user-selected frequency must remain the source of truth for the next due date.
2. Specifically verify 3-month recurrence: selecting 3 months must produce a 3-month next due date, not 1 month.
3. After completing an inspection, the completed inspection and its comment/details must appear in History.
4. Audit the full Inspection loop: initial due date → completion → next due date → recurring record → history.
5. Prevent impossible/future-dated completion. Example: on 18/08, a task due on 18/11 must not be completable.

5. Cross-Module History & Recurring Flow

1. Standardize History across applicable modules, following the working PM pattern.
2. Main dashboard shows active/upcoming recurring tasks; completed tasks are recorded in a separate History section/button.
3. Completion comment/details must create a History entry.
4. The recurring loop must create the next scheduled task without losing the completed historical record.
5. History must persist after refresh/re-login and show actual stored completion data.
6. Apply the same flow consistently across Backup, PM, QA, Inspection and other applicable task modules.

6. Notes

1. Remove Share Link from Notes.
2. Add a Pin option near the Notes View option so any note from any module can be pinned.
3. Allow users to directly add a note to Pinned Notes.
4. Pinned notes should retain source/module context.

7. Notifications

1. Keep deleted notifications available for 30 days and add a Deleted/Trash category.
2. Remove Email Notifications from Settings.
3. Make In-App Push Notifications functional.
4. Remove DMS Alerts.
5. Keep Maintenance, Backup and QA alerts.
6. Add alert toggles for applicable/new modules and make them functional: OFF means no notification; ON means notifications work.
7. Remove/disable Critical Mode.

8. User Management & Access

1. Keep the current 3 roles for now.
2. Connect authentication/user identity to Supabase when integrated.
3. All data changes made by any user must be shared/persisted so other users see the same updated operational data after login.
4. Remove IT Roles from User Role Management.
5. Remove Permission Matrix.
6. Remove Access Log.
7. Remove Invite Sent option.
8. Attach/sync users with Supabase user data.
9. Allow administrator deletion or deactivation of users.

9. Monthly Hard Disk Tracker

1. Remove all demo data.
2. Dispatch Date must automatically use the start/first date of the relevant month.
3. Date-gate action buttons so actions are usable only when their configured date/time limit has arrived.
4. Preserve the time limits already defined for the module.
5. Clarify/remove Accountability if it has no defined business purpose; otherwise connect it to the intended workflow.
6. Create the Monthly Hard Disk Tracker PDF in the same professional RCC/PM pattern, adapted to its own fields/content.
7. Verify monthly recurrence, dispatch-date calculation, completion, next-cycle generation and history.

10. Global Testing / Logic Audit

1. Audit date validation across all task modules; prevent completion before eligibility/due date.
2. Audit recurrence loops; never silently replace the user-selected frequency with a default.
3. Audit completion → history → next recurring task across applicable modules.
4. Audit persistence after refresh and when another user logs in.
5. Audit shared operational data visibility across users.
6. Audit every notification toggle against actual notification behavior.

7. Audit the 30-day deleted-notification retention.
8. Audit that completed records cannot be snoozed where prohibited.
9. Remove demo/placeholder data before final delivery.
10. Keep fixes targeted; do not modify unrelated modules unless a shared data flow genuinely requires it.

Note: This is the current consolidated list. Further testing findings can be appended without removing confirmed requirements.
